

Shared falsification paths

Each path falsifies BOTH the QFT sector and the Einstein sector simultaneously.

T-parity-axiom failure

alternative T-parity assignment of the defect field flips the sign of the two-loop closure
(companion electroweak-scale paper, falsification path F2)

Constraint violation

coefficient-reduction constraints C1, C2, C3 under the reduction system R fail to follow
Lemma-4 + Lemma-7 forms

Mapping inconsistency

the same full topology tuple (n, g, s, w, r) returns different lemma classes in QFT vs
Einstein sectors

Cross-sector reclassification failure

an observable cannot be classified consistently in both QFT and Einstein sectors
